KYBELLA CONSENT

Kybella is an injectible drug FDA approved for the treatment of submental fullness, commonly referred to as double chin or fat around the neck. Kybella works by disrupting membranes of fat cells. Kybella is classified as a bile acid or bile salt. The injured fat cells are cleared through the body's natural mechanisms.

1 to 4 series of injections of Kybella may be necessary to achieve the optimal results depending how heavy one's neck is and the ultimate desired out come. Injections are spaced 4-8 weeks apart. Patients may experience swelling (few days to 2 weeks), bruising (a few days), and numbness (a few weeks).

I consent to the administration of Kybella by Dr. Rokhsar by signing below. I agree that all risks, benefits, and alternatives have been discussed with me. I understand the practice of medicine is not an exact science, and as such no guarantees have been given to me about the outcome. I understand that there is a cost for every injection and that there are no refunds regardless of outcome.
